

Question 1

- a) 4 process will be created (including the grandparent).
- b) 4 'c' variable will be generated.
- c)

Pid (Somewhat in creation order)	Value of 'c' variable
1	5
2	9
3	3
4	5

Question 2

The only thing that I should mention about my code is this line:

```
print_info_about_process(level1_childs_pid, 0, 4);
```

even though I'm printing info about a process that is at 4th or 3rd level.

These are the processes that have no child at all. So I decided to choose an array that is defined at all scopes. And I'm sending 0 as number of childs parameter. So None is printed for these processes.
